

The Street lighting specialists

WHY STREET LIGHT DESIGN IS IMPORTANT.

Street lighting is something many people take for granted. Good street light design reduces the likelihood of accidents for pedestrians, cyclists and vehicle users. It also increases safety by reducing crime and vandalism. Good design will also consider the aesthetic value of lighting as well as minimising stray light output or “spill”. Design for Power takes pride in providing the best possible street light design and has experienced engineering staff to provide you with quality designs at a competitive price.

When designing a lighting layout We look at many factors to ensure we provide you with the best quality design including:

- Type of lighting—light colour / output, running cost, effectiveness
- Pole type – frangible, slip base, see saw decorative etc
- Road surface (reflectivity)
- Maintenance (ongoing costs and performance)
- Aesthetics
- Safety (Legal requirements)

“We can also provide quotes for supply and installation of all equipment if required from authorised, reliable installers and suppliers.”

Please call us for a free evaluation or quote. ▶▶▶

- Street lighting Design
- Car Park or Flood lighting
- Full drafting service using AutoCAD
- Lighting level plans
- Compliance Audits and evaluation of existing lighting

“All our lighting is designed to conform to current Australian standards”
